**Reason for Allowance**

1. For claim 7, the closest prior art, Takada (US 2003/0110406), discloses a power management system which based on a signal of a circuit, which outputs data to a second circuit (Fig 1; 31), controls the clock supply to the 2nd circuit. However, this signal is a request to send data to the 2nd circuit (Fig 1; 31) and not a signal if data has been output. The next closest prior art Lim et al (US 2004/0160898) discloses a system with shuts off the clock if the macro is processing/is expected to process a packet. However neither by anticipation nor reasonable combination does the prior art teach that the "macro" from which the packet data is outputted includes a 1<sup>st</sup> and 2<sup>nd</sup> output signal units nor the output of the second signal (produced by the second unit), which produces a 1st signal, that is used to turn off the clock supply if the signal indicates no output for a predetermined time. Neither by anticipation nor reasonable combination does the prior art teach the following details of claim 7: "a clock management unit which causes said clock buffer corresponding to said macro to be controlled to stop supplying the clock when no packet data is output for the predetermined time from all the routes of said macro on the input side of said macro to be controlled, wherein said macro on the input side comprises a first signal output unit which outputs, to said clock management unit, a first packet output notification signal which indicates that the packet data is output, and said clock management unit comprises a packet output detection unit which causes said clock buffer to start supplying the clock when the first packet output notification signal is enabled and stop supplying the clock when the first packet output notification signal is not enabled again within the predetermined time, wherein said macro on the input side comprises a plurality of routes to output the processed packet data, and said first signal output unit outputs, to

said clock management unit, a first packet output notification signal which indicates that the packet data is output from at least one of the routes, and wherein said macro on the input side comprises a second signal output unit which outputs, to said first signal output unit for each of the routes, a second packet output notification signal which indicates that the packet data is output, and said first signal output unit comprises a gate circuit which generates the first packet output notification signal by ORing the received second packet output notification signal.”
